

Florida High Performance Green House Project

In 2011 the Florida High Performance Green House Project selected the Housetron to treat the whole house water supply plus a cistern based collection system. The whole focus of the Green House Project was to build an energy efficient home that has minimal impact on the environment.

In selecting the chemical free Housetron, no power is consumed, no water is wasted with backwashing and no additional space is required to accommodate the unit as it replaces a small section of pipe.

Results

After two years the owner / operator of the Florida High Performance Green House Project is delighted with the results of the Housetron installation. The home is scale free and this goal has been achieved as expected without the use of salt, chemicals or power. With no backwashing required demands on the local water supply are kept to a minimum.
